Case Study: Hotel & Leisure

Two Q-ton heat pumps installed at Lancaster Hall Hotel

The Lancaster Hall Hotel is situated in the heart of London's popular Lancaster Gate & Bayswater which attracts many tourists and business travellers.

reductions compared to their existing boiler and 45% savings on carbon emission.

In order to make sure Lancaster Hall Hotel can accommodate sanitary hot water efficiently for all of their customers, MHIAE connected two Q-ton to two 2,000 litre hot water storage tanks.

Mitsubishi supplied an effective solution improving quality and comfort to their client. Q-ton ticked all the boxes and contributes to substantial running cost and carbon emission savings.

The hotel consists of two separate boiler rooms with completely segregated hot water and heating systems utilising five boilers running at different pressures in order to cater for 250 people on site.

"If anyone is considering a Q-ton system I cannot recommend Mitsubishi highly enough."

The system is now fully operational and supplies 12,000 litres per day of domestic hot water at 65°C.

Mr U. Maynard
Managing Director

The hotel is now saving up to 40% running costs
